

StableGROUND

Stabilising below ground conditions

The StableGROUND product range offers a selection of effective ground control materials. Initially introduced to supplement the StablePAVE and StableGRASS grids, these products are equally valuable as standalone solutions. **The range comprises:**

StableGROUND Geo-textile

a woven stabilisation membrane for use below sub base or gravel paving to prevent contamination of permeable layers and adding a reinforcement layer, increasing resistance to rutting and ground movement. Particularly beneficial under paver bedding layers. **Fig 1 & illustration**

StableGROUND Geoweb

Three dimensional cellular confinement system for control of lateral and vertical movement below temporary and permanent paving layers. Aids load distribution over weak sub bases such as tree roots surround and no dig applications. Ideal base stabilisation for paved surfaces and surface stabilisation for unpaved access ways. **Fig 3**

The StableGROUND materials add invisible strength and stabilisation, enhancing the specification of any green and environmentally conscious ground construction.

StableGROUND Turf-mesh

reinforcing mesh for placement over grassed areas, to reduce erosion and facilitate pedestrian and vehicle access across green surfaces. Available in standard (Pedestrian) and premium (Vehicular) grades. An ideal, cost effective solution for temporary access and parking **Fig 2**

StableGROUND Grass Mat

Impact absorbing grass paving system, with RAPRA approval at critical fall height of 3 metres. Supplied in mats of 1.5 x 1.00mtr x 23mm deep which can be cable tied together for fast installation makes StableGROUND – Grass Mat a safe and effective playground paving solution. Can be used in conjunction with standard grade StableGROUND Turf mesh where below ground stabilisation is necessary. **Fig 4**
