

The range of Bag Dewatering systems are an affordable solution for dewatering, drying and packing trade effluent and municipal wastewater sludge. Due to the compact nature of the design, the innovative Bag Dewatering systems offer a simple and effective solution for even the smallest of wastewater treatment environments.

Various Bag Dewatering system options are available ranging from manual models (two bags) to automatic models (up to twelve bags) and pressurised dewatering. Automatic models are effective in treating up to 20m³ per day (depending on the content). Automatic models require minimal operational involvement. As the system is predominantly regulated by a control panel, once installed, the only notable manual input relates to the replacement of the Dewatering Bags.

Top 10 Benefits

- Low capital and maintenance costs
- Dry solids content of 15-35% can be achieved
- One machine can treat up to 20m³ per day
- Compact design
- Quick and easy to install and operate
- Dewatering bags are simple to change
- System can be easily expanded
- Various options available from 2 to 12 bags
- Water repellent bags protect against rainwater
- Available for purchase or hire
