The Catalyst Building at Staffordshire University is a new 8,800 sqm four-storey building, allowing the delivery of apprenticeships & practical skills in a flexible high-quality working space. The new building provides social, study, and teaching resources as well as space for university events, community activities, food outlets and more. Langley Design were approached by Vinci Construction to produce a secured external store incorporating galvanised weldmesh panels to house the site generator and bin store. Using our bespoke manufacturing and design capabilities we provided an attractive unit based on our popular Sheldon product range, to allow for the generator to be fully housed and secured while delivering the required space for the storage of site bins and other items. At Langley Design we utilise our vast experience within the street furniture market to provide a range of solutions in a variety of styles and materials to achieve an outcome which not only matches the client's requirements but also project specific conditions and budget constraints.
