Up-and-over garage doors:
Europe's best-selling garage door

RollMatic roller garage door:
more free space in the garage
with innovative Hörmann technology

Automatic Garage Doors from Europe's No. 1

NEW: with the BiSecur bi-directional radio system

Sectional garage doors

Sectional doors open vertically, thus providing more space both in front of and inside the garage, which is a significant advantage in case of short driveways or large vehicle dimensions. Another advantage: irrespective of the shape of the garage opening – square, chamfered, with segmental or Norman arch – a Hörmann sectional garage door always fits perfectly.

Up-and-over garage doors

With over 8 million sold, the up-and-over garage door is the most popular garage door in Europe. With this classic model, Europe's No. 1 supplier enables you to profit from all the experience gained in over 75 years in the door construction business.

RollMatic roller garage door

RollMatic roller garage doors provide maximum parking space both inside the garage and in front of it. Proven tension spring technology not only prevent damage to the operator mechanism but also allows the door to be operated manually with complete ease.

Side sliding sectional doors

For special fitting situations: you don't want to cover your light or need storage space under the ceiling?

From now on, this is no longer a problem thanks to Hörmann's side sliding sectional door.

BiSecur

Our bi-directional, high-security BiSecur radio system is based on future-oriented technology. Thanks to the convenient door position query function, you no longer need to go outside to check your door: at the press of a button you can see whether the door is closed.
