PREPERATION AND APPLICATION:

If your area has play equipment, we can help you calculate the critical fall height - 20mm is a minimum if used just as a decorative cushion. DekorGrip rubber crumb system can be laid over a range of surfaces including tarmac, concrete and compacted MOT Type 1.

Once the correct depth is created, empty pre-measured rubber crumb and resin into a forced action mixer and then into your retained area.

Final finish is achieved by simply levelling using a straight edge and smoothing out using a hand trowel. For best results we recommend using a hand roller for a final finished surface.

**SUPPORT AND MAINTENANCE:**

- ◆ Samples, full method and safety data sheets, demonstrations and on-site application supervision available.
- ◆ Constant helpline to answer questions and calculate critical fall height requirements.
- ◆ Forced action pan mixer hire available.
- ◆ Keep the surface regularly swept clean and hose with clean water when necessary.
